

Cloud Computing 2

Exam Information	Description
Exam number 892 Items 31 National Career Cluster Information Technology Certification available Yes	The Cloud Computing 2 course is a natural extension of the concepts learned in Cloud Computing 1. Candidates will continue to prepare themselves to sit for cloud computing professional certifications. This course expands on basic cloud computing principles and concepts including programming, networking, cybersecurity, hardware, software, data storage, data collection, and the impacts of computing. This advanced course will take candidates from conceptual understanding of these principles to real-world cloud applications across multiple industries.

Exam Blueprint and Performance Skills

Standard	Percentage of exam score
1. Managing Efficiency & Security	28%
2. Creating Cloud Environments To Scale	22%
3. Managing Cloud Resources: Big Data & Cryptocurrency	22%
4. Emerging Technology	28%
5. Skills For Career Development (Optional)	

*Includes performance skill evaluation

Standard 1 - Managing Efficiency & Security

Managing Efficiency and Security: Candidates will resolve common security alerts, diagrams instance states and transitions, and explains how to choose the most cost-efficient instance type.

Objective 1 Security Models: This module will give candidates an introduction to the shared security model as it relates to the three main cloud services. They will understand the responsibilities of the client and cloud service for patching, Operating System updates, and data security using the Shared Responsibility Model.

1. Understand the Shared Responsibility Security Model
 - a. Responsibilities of the customer (for example: customer data, network configuration, applications, IAM, and other responsibilities of security IN the cloud)
 - b. Responsibilities of the cloud service provider (for example: software, regions, hardware, and security OF the cloud)
 - c. Understand the difference between Type I and Type II hypervisors
2. Determine the security responsibility for cloud services
 - a. Prioritize a company's security needs, evaluate the risk, and understand the vulnerabilities
 - b. Understand the Principle of Least Privilege (PoLP) as the concept that the least number of permissions is to be applied to a user
 - i. Where it can be applied, for example:
 1. a user can search (READ)
 2. add (WRITE)
 3. delete (DELETE)
 4. modify (WRITE and/or DELETE)
 - ii. To whom does it apply to, for example:
 1. end users
 2. systems
 3. processes
 4. networks
 5. databases
 6. applications
3. Analyze how the shared security model accounts for common threats to the cloud computing model.

Objective 2 Shared Security: Candidates will be introduced to security assessment services and how to resolve any alerts.

1. Understand the use of a security assessment service
2. Understand the results of a security assessment service, including the five categories: cost, optimization, fault tolerance, performance, service limits, and security
3. List the steps required to resolve an automated security alert

Objective 3 Cloud Services and Instance States: Candidates will manage instances from launch through termination. Instance lifecycle and transition between states will be

introduced.

1. Describe the six instance states and predict the instance state, for example: pending, running, stopping, stopped, shutting down, and terminated
2. Understand which type of virtualization instance can run inside an OS
3. Indicate instance usage billing for each instance state
 - a. On-Demand Instances – billed when used with no long-term commitment
 - b. Reserved Instances – purchased in advanced for a discount, you pay for the entire term regardless of actual use
 - c. Spot Instances – an unused instance that is available at a discount, available for use when available, good for workloads that can be processed at any time
4. Understand the differences between rebooting, stopping, hibernating, and terminating your instance
5. Understand Audit Logs

Optional: Standard performance evaluations on the final page of this document.

Standard 2 - Creating Cloud Environments To Scale

Creating Cloud Environments to Scale: Candidates will differentiate between dynamic and static websites.

Objective 1 Dynamic Web Servers I: Candidates will compare static and dynamic websites.

1. Compare static and dynamic website
 - a. Understand the features of each
 - b. Dynamic websites change with user interaction
 - i. Static websites do not change with user interaction
2. Understand the process of setting up a static website
3. Types of dynamic websites
 - a. Built on Content Management Software (CMS)
 - b. Built from scratch

Objective 2 Dynamic Web Servers II: Candidates will launch and create a dynamic server.

1. Understand the purpose of a content delivery network (CDN)
2. Understand how a CDN relates to speed of a website and edge locations (for example: websites using a CDN have faster speeds as data is cached at edge locations, closer to end-users)

Objective 3 Serverless Computing: A cloud service that runs code in response to events and

automatically manages the computing resources required by that code.

1. Understand how to create a serverless compute function using a serverless compute console
2. Know the instance lifecycle
3. Understand the chargeback model as it applies to the costs of IT services,

hardware, or software

4. Understand purchasing options for instances and usage billing, for example: Pending, Stopped, Shutting-down, Terminated = Not billed, Running = billed
5. Understand the transitions between instance states:

Objective 4 Auto Scaling in Cloud Environments: Candidates will learn about the functions of auto

scaling and create an auto scaling group.

1. Describe the three main functions of auto scaling
 - a. Monitor the health of running instances
 - b. Replace impaired instances automatically
 - c. Balance capacity across availability zones
2. Understand a launch template
3. Understand an auto scaling group
4. Know how to create a plan for monitoring an auto scaling instance or group
5. Understand how to enable syslog forwarding to centrally monitor cloud environment

Optional: Standard performance evaluations on the final page of this document.

Standard 3 - Managing Cloud Resources: Big Data & Cryptocurrency

Managing Cloud Resources: Big Data and Cryptocurrency: Candidates will learn the benefits and risks of using big data.

Objective 1 Big Data: Introduce the candidate to the concept of big data and the difference from traditional types of data.

1. Define big data and the “three V’s”
 - a. Volume
 - b. Variety

- c. Velocity
- d. Veracity and Value (other commonly used “V” descriptors)
- 2. Evaluate the pros and cons of big data
- 3. Ethical and legal issues related to big data

Objective 2 Big Data Processing Cycle: Candidates will learn the big data processing cycle, its activities and challenges of each phase.

- 1. Understand various types of data
- 2. Identify the types of cloud migration and conversion methods
- 3. Understand various types of processing methods
- 4. Identify the different RAID levels for data storage
- 5. Understand high availability functionality
- 6. Understand various types of quality challenges
- 7. Understand various types of analysis techniques
- 8. Big Data Processing Cycle phases
 - a. Collect
 - b. Store
 - c. Process & Analyze
 - d. Consume & Visualize

- 9. Understand the types of data storage
 - a. Big data storage – architecture that collects and manages large data sets and enables real-time data analytics
 - b. Nonrelational databases – a database that does not use rows and columns found in traditional database systems
 - c. Data warehouses – central stores of integrated data from one or more sources
 - d. Data lake – repository of data stored in its raw format

Objective 3 Blockchain and Cryptocurrency: Candidates will learn how blockchains are created and maintained to support immutability and validity. They will also be introduced to cryptocurrency technologies.

- 1. Understand blockchain and how they function in the cloud
- 2. Explain how blockchain ensures the validity and immutability of transactions in the cloud
- 3. Understand the pros and cons of blockchain business applications
- 4. Understand cryptographic hash
- 5. Understand cryptocurrencies

Optional: Standard performance evaluations on the final page of this document.

Standard 4 - Emerging Technology

Emerging Technology

Objective 1 Artificial Intelligence Capabilities and Impacts: Candidates will learn about the back end

of artificial intelligence (AI).

1. Recognize capabilities of artificial intelligence (ex: image and video analysis, natural language, personalized recommendations, virtual assistants, and forecasting)
2. Understand how AI can enhance the customer experience
3. Analyze the ethical implementation of artificial intelligence

Objective 2 Machine Learning: Candidates will learn how machine learning can be applied to solving

problems.

1. Explain machine learning and how it can help address a need or problem
2. Understand procedures in machine learning and applications used to create ML programming
3. Machine learning capabilities:
 - a. Recommendations
 - b. Forecasting
 - c. Recognition

Objective 3 Internet of Things: Candidates will learn how cloud technology facilitates the Internet of

Things (IoT)

1. Understand the Internet of Things as the network of common, everyday devices embedded with sensors and communication technologies for sending and receiving data over the internet
2. Types of IoT
 - a. Industrial – building applications for predictive quality and maintenance and to remotely monitor operations
 - b. Home/consumer – building connected home applications for home automation, home security and monitoring, and home networking
 - c. Commercial/municipal – applications for traffic monitoring, public safety, and health monitoring
3. Explain the relationship between cloud technology and the Internet of Things

4. Evaluate security and privacy concerns with the increasing IoT usage

Optional: Standard performance evaluations on the final page of this document.

Standard 5 - Skills For Career Development (Optional)

Skills for Career Development

- Objective 1** Candidates will demonstrate positive workplace behaviors that enhance employability and job advancement such as regular attendance, promptness, attention to proper attire, maintenance of a clean and safe work environment, appropriate voice, and pride in work.
- Objective 2** Candidates will demonstrate positive personal qualities such as flexibility, open-mindedness, initiative, listening attentively to speakers, and willingness to learn new knowledge and skills.
- Objective 3** Candidates will employ effective reading and writing skills; solve problems and think critically; and demonstrate leadership skills and function effectively as a team member.

Optional: Standard performance evaluations on the final page of this document

Performance Skills Evaluation

Exam name: Cloud Computing 2

Candidate Name: _____

Performance assessments may be completed and evaluated any time before the certification is issued. The following performance skills can be used in connection with the associated standards and exam. The evaluator will function as the subject matter expert to determine if the candidate meets the skills requirements with a Yes/No for passing.

Standard 1 – Managing Efficiency and Security • List the steps required to resolve an automated security alert • Determine the most optimal billing option for instances for a company • Diagram the transitions between instance states from launch to termination • Determine the most appropriate instance state for a given situation	Pass:
Standard 2 – Creating Cloud Environments to Scale • Create a content delivery network distribution to increase the speed of a website • Candidates will launch a dynamic web server • Create a launch template and an auto scaling group • Develop a plan for monitoring an auto scaling instance or group	Pass:
Standard 3 – Managing Cloud Resources: Big Data and • Candidate will be able to access and manage big data from the cloudCandidate will understand the complete big data ecosystem	Pass:
Standard 4 – Emerging Technology • Candidate will explore AI services and determine which type of AI product would address a particular issue – some examples could be: ○ Amazon Comprehend: discover insights and relationships in text ○ Amazon Forecast: increase forecast accuracy using machine learnings ○ Amazon Lex: build voice and text chatbots ○ Amazon Personalize: build real-time recommendations into your applications ○ Amazon Polly: turn text into lifelike speech ○ Amazon Rekognition: analyze image and video ○ Amazon Textract: extract text and data from documents ○ Amazon Translate: translate texts with higher accuracy	Pass:

- Amazon Transcribe: translate audio files to text
- Candidates will create a machine learning algorithm
- Candidate will create a connection to IoT devices

Standard 5 – Skills for Career Development

- Candidates will demonstrate positive workplace behaviors that enhance employability and job advancement such as regular attendance, promptness, attention to proper attire, maintenance of a clean and safe work environment, appropriate voice, and pride in work.
- Candidates will demonstrate positive personal qualities such as flexibility, open-mindedness, initiative, listening attentively to speakers, and willingness to learn new knowledge and skills.
- Candidates will employ effective reading and writing skills; solve problems and think critically; and demonstrate leadership skills and function effectively as a team member.

Pass:
